Fitz Water Design provides a maintenance program that can be adjusted to the needs/wants of our customers and their water features. The purpose of this program is to furnish the labor and materials/treatments to maintain an ecologically balanced water feature. There are five essential parts for this to happen: biological filtration, mechanical filtration, rocks and gravel, plants and fish, and beneficial bacteria.

*A weekly maintenance visit will include the following services:*

- ✓ Cleaning skimmer net
- ✓ Cleaning filter pads (if needed)
- ✓ Checking pump for proper flow
- ✓ Checking lights and replacing bulbs as needed
- ✓ Checking automatic water fill valve for proper function
- ✓ Adding water if no fill valve is present
- ✓ Trimming all pond and stream plants of dead leaves, string algae, & flowers
- ✓ Replacing any gravel or rock as needed (covering liner)
- ✓ Applying bacteria or string algae buster as needed
- ✓ Checking edges
- ✓ Making a list of all material/products and plants needed for next visit

We bill our maintenance customers on a monthly basis for the month prior. The invoice includes the maintenance labor fee plus the fee for any additional products/bacteria used during that month. Attached to the invoice you will receive a maintenance checklist including the date and services that were provided during that month.

**This program is designed for you to be able to enjoy your  
water feature while we do all the dirty work for you!**

If you are interested in our maintenance program or would like more information about it please call today.

Sincerely,

Cliff Fitzwater
